

**Goal:**

PeerSync contains tools for importing data from files to dynamically create Jobs. Within an organization, one generic profile can be created, and utilizing text files, specific information about the user and the desired folders to be synchronized can be imported dynamically.

*This would be a useful feature if you need to synchronize to Multiple Machines from one specified Source, or vice versa.*

**PLEASE NOTE:**

**The use of text files is available with [PeerSync Enhanced Package](#)**

---

**Lists can be used in Source and Target path names as such:**

Source: <<\$FileNameSources.txt\$>>

Target: <<\$FileNameTargets.txt\$>>

**Corresponding entries of each delimited file entry will be used to dynamically create a Job based upon the Jobs properties.**

**Sample of text file below**

---

Path\_computer2a

Path\_computer2b

Path\_computer2c

---
